

Tank Inerting

We deliver:

- Assessment of inerting-gas purity and consumption
- Control of pressure in tank headspace
- Audit with oxygen content analysis
- Up to 40% capex savings vs. single-tank solutions
- Safe, reliable inerting solution

The Industry Challenge

Fire and explosion prevention is a serious challenge when handling flammable products. Minimizing risk requires avoiding energy accumulation and removing air as a combustive oxygen source. Industries largely resort to oxygen removal by using inert gas protection.

In addition to fire-safety concerns, air can also negatively affect products that are sensitive to oxygen, moisture or other contaminants. Therefore, keeping air out of tanks, vessels and packaging is critical at all levels of storage and production.

The Nexelia Solution

A comprehensive gas solution designed for and adapted to your specific needs, **Nexelia for Tank Inerting** combines the best of our gases, application technologies and expert support. As with all solutions under the **Nexelia** label, we work closely with you to predefine a concrete set of results, and we commit to delivering them.

Nexelia for Tank Inerting is a packaged offer that includes installation design and process control, optimized inert-gas supply, safety training on anoxia prevention, startup and commissioning.

If you are looking to implement a safe, reliable, high-quality inerting solution, **Nexelia for Tank Inerting** offers you a truly effective option.

Your Advantages

• Safety and reliability

All equipment can be used in most types of installations while complying with technical requirements and safety standards (NFPA¹, API², ATEX³). Our on-site nitrogen supply option includes a backup storage tank for total reliability.

• Customization

We factor in vessel size, number and contents, as well as emptying rates, and production schedules to create a customized solution. Our engineers can help you define a solution based on the degradation and flammability data you provide for your specific products.

We use forecasting models developed by Air Liquide to calculate the volume changes occurring in the headspace due to temperature variation or liquid pump-out.

• Cost efficiency

To boost savings and decrease flow rates, we conduct a thorough audit of your system. We help you improve yields by limiting damages caused by moisture, oxygen content and air impurities. Your equipment is also protected from the negative effects of oxidation. Our service option offers the ability to optimize nitrogen consumption and to track other process variables in order to minimize process upsets and optimize costs.

³ The European ATEX Directive 2014/34/EU covers equipment and protective systems intended for use in potentially explosive atmospheres

⁴ Minimum Oxygen Concentration

Core Features

Nixelia for Tank Inerting consists of:

• **Inert gas supply:**

Three gases	Three grades
- Nitrogen (bulk or onsite generation)	- Industrial-quality gases
- Argon (bulk) for sensitive applications	- PHARGALIS™ gases for compliance with Good Manufacturing and Distribution Practices for pharmaceutical excipients
- Carbon dioxide (bulk)	- ALIGAL™ gases for food applications (edible oils)

• **Application technologies:**

Each **TANK INERTING SYSTEM** is designed to continuously maintain a targeted overpressure in an enclosure by causing the opening or closing of two pneumatic on/off valves, which regulate inert-gas supply and relief.

We offer two versions from the Air Liquide-designed range of equipment.

- **TANK INERTING SYSTEM-VE** is an electronic unit to control one or two inerting processes. You can also connect the unit to an oxygen analyzer to set an alarm on the O₂ content in the tank headspace.

- **TANK INERTING SYSTEM-VEM** is suitable for inerting up to 60 tanks using electronic offset units connected to one master control unit. Whichever configuration you choose, you'll benefit from the full support of our inert-gas atmosphere experts, from the auditing of your current system capability to the complete rollout of your new one, including preliminary and detailed design, full installation and startup.

Case Study

Case study #1: Subcontractor in the pharmaceutical industry

• **Customer need: compliance with HSE standards of pharmaceutical groups**

- 24 tank farm
- Acetone and toluene storage

• **Our solution:**

- **TANK INERTING SYSTEM-VEM**
- Additional O₂ monitoring in tank headspace

• **Benefits:**

- Safety and traceability monitoring (HSE requirements)
- 40% lower investment cost vs. single-tank systems
- Lower maintenance costs

Case study #2: Production of paint ingredients

• **Customer need: inert gas protection optimization**

- Batch process
- Multiple solvents (xylene, glycerin) and powders (diethylene glycol, benzoic acid, phthalic acid)
- Distillation temperature up to 260°C

• **Our solution:**

- Evaluation of the hazard level with respect to the ATEX³ regulations: monitoring of the residual O₂ content during a whole batch process
- Cycle time and N₂ flow-rate adjustment

• **Benefits:**

- O₂ residual content 5% below MOC/2 at the most hazardous phase of the process⁴.

Case study #3: Industrial liquid-waste management

- **Customer need: expansion of industrial activity**
 - 4 storage tanks
 - ATEX management using nitrogen blanketing
- **Our solution:**
 - **TANK INERTING SYSTEM-VEM**
 - Additional O₂ monitoring in tank headspace
- **Benefit:**
 - ATEX Z1 danger zone lessened to ATEX Z2
 - 2000 m² freed up space to create maintenance shop

Case study #4: Production of edible oil

- **Customer need: protect edible oil against oxidation during storage and transfer**
 - Maintaining an inert atmosphere in the headspace of storage tanks
- **Our solution:**
 - **TANK INERTING SYSTEM-VE**
- **Benefit:**
 - Optimized gas consumption thanks to precise regulation
 - Safe operation
 - Traceability
